

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

Marco Casari

University of Turin

Complex system in neuroscience, 12 December 2023

- In this presentation the main topics of the paper are presented in order of appearance.
- Source code of proposed exercises is available at <https://github.com/mirasac/sistneur/tree/main/code>.

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

└ Introduction

- Predictive coding model of Rao and Ballard.

1. Prior predictions are compared to stimuli and the model parameters are updated considering prediction errors, features corresponding to receptive fields in the the primary sensory cortex are learned.

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

└ Introduction

- Predictive coding model of Rao and Ballard.
- Free-energy model of Friston.

1. Prior predictions are compared to stimuli and the model parameters are updated considering prediction errors, features corresponding to receptive fields in the the primary sensory cortex are learned.
2. Weight stimuli by their noise, learn features using their covariance, implement attentional modulation changing the variance of attended features.

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

- Predictive coding model of Rao and Ballard.
- Free-energy model of Friston.
- Hebbian plasticity.

└ Introduction

1. Prior predictions are compared to stimuli and the model parameters are updated considering prediction errors, features corresponding to receptive fields in the the primary sensory cortex are learned.
2. Weight stimuli by their noise, learn features using their covariance, implement attentional modulation changing the variance of attended features.
3. Synaptic strenght is changed proportionally to activities of pre-synaptic and post-synaptic neurons.

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

└ Introduction

- Predictive coding model of Rao and Ballard.
- Free-energy model of Friston.
- Hebbian plasticity.
- Free energy minimization.

1. Prior predictions are compared to stimuli and the model parameters are updated considering prediction errors, features corresponding to receptive fields in the the primary sensory cortex are learned.
2. Weight stimuli by their noise, learn features using their covariance, implement attentional modulation changing the variance of attended features.
3. Synaptic strenght is changed proportionally to activities of pre-synaptic and post-synaptic neurons.
4. Minimization of free energy can be seen as the base of many theories of perception.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- └ Introduction

- └ Working hypotheses

1. The state of a neuron is determined only by the synaptic weight and the state of its input neurons.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

└ Working hypotheses

1. The state of a neuron is determined only by the synaptic weight and the state of its input neurons.
2. Synaptic plasticity depends only on the activities of pre-synaptic and post-synaptic neurons.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Introduction

└ Working hypotheses

1. The state of a neuron is determined only by the synaptic weight and the state of its input neurons.
2. Synaptic plasticity depends only on the activities of pre-synaptic and post-synaptic neurons.
3. The state of a neuron is the result of the application of a monotonic function to the linear combination of states and synaptic weights of input neurons.

- Local computation.
- Local plasticity.
- Basic neuronal computation.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Single variable model

- Feature is a scalar variable $v \in \Omega_v$
- Stimulus is a scalar variable $u \in \Omega_u$

1. The model describes the inference of a single variable from a single sensory input.

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Single variable model

- Feature is a scalar variable $v \in \Omega_v$.
- Stimulus is a scalar variable $u \in \Omega_u$.
- Relation between feature and stimulus is a differentiable function $g : \Omega_v \rightarrow \Omega_u$.

1. The model describes the inference of a single variable from a single sensory input.
2. In general inferred variable and sensory input are related by some smooth function.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Single variable model

1. The model describes the inference of a single variable from a single sensory input.
2. In general inferred variable and sensory input are related by some smooth function.
3. Sensory input and stimulus are drafted from the same space.

- Feature is a scalar variable $v \in \Omega_v$.
- Stimulus is a scalar variable $u \in \Omega_u$.
- Relation between feature and stimulus is a differentiable function $g: \Omega_v \rightarrow \Omega_u$.
- Sensory input $p(u|v)$ is affected by gaussian noise and it has mean $g(v)$ and variance Σ_v .

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Single variable model

- Feature is a scalar variable $v \in \Omega_v$.
- Stimulus is a scalar variable $u \in \Omega_u$.
- Relation between feature and stimulus is a differentiable function $g: \Omega_v \rightarrow \Omega_u$.
- Sensory input $p(u|v)$ is affected by gaussian noise and it has mean $g(v)$ and variance Σ_v .
- Prior knowledge of the feature $p(v)$ follows a gaussian distribution with mean v_μ and variance Σ_μ .

1. The model describes the inference of a single variable from a single sensory input.
2. In general inferred variable and sensory input are related by some smooth function.
3. Sensory input and stimulus are drafted from the same space.
4. Information gained and constantly updated from previous experience.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Exact solution to the inference problem

1. Knowledge of feature depending on a given stimulus is the posterior. Prior knowledge on the feature is the prior, distribution of stimulus is the likelihood.

• Bayes theorem:

$$p(v|u) = \frac{p(v)p(u|v)}{p(u)} \quad (1)$$

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Exact solution to the inference problem

1. Knowledge of feature depending on a given stimulus is the posterior.
Prior knowledge on the feature is the prior, distribution of stimulus is the likelihood.
2. In general, marginal likelihood is difficult to evaluate.

- Bayes theorem:

$$p(v|u) = \frac{p(v)p(u|v)}{p(u)} \quad (1)$$

- Marginal likelihood of stimuli:

$$p(u) = \int_{\Omega_v} p(v)p(u|v) dv \quad (2)$$

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Exact solution to the inference problem

- Bayes theorem:

$$p(v|u) = \frac{p(v)p(u|v)}{p(u)} \quad (1)$$

- Marginal likelihood of stimuli:

$$p(u) = \int_{\Omega_v} p(v)p(u|v) dv \quad (2)$$

- No implementation in simple biological systems.

1. Knowledge of feature depending on a given stimulus is the posterior. Prior knowledge on the feature is the prior, distribution of stimulus is the likelihood.
2. In general, marginal likelihood is difficult to evaluate.
3. Complex calculations and infinite nodes are needed to represent each value of the posterior.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Approximate solution to the inference problem

1. Evaluating the mode of the posterior instead of the whole function is more biologically plausible.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- Most likely value of the feature is a scalar variable $\phi \in \Omega_\phi$.
- Equivalent to maximize negative free energy with respect to the feature:

$$F(\nu, u) = \ln (p(\nu)p(u|\nu)) \quad (3)$$

└ Single variable model

└ Approximate solution to the inference problem

1. Evaluating the mode of the posterior instead of the whole function is more biologically plausible.
2. The most likely feature value is the fixed point of the gradient descent method applied to the negative free energy.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Approximate solution to the inference problem

1. Evaluating the mode of the posterior instead of the whole function is more biologically plausible.
2. The most likely feature value is the fixed point of the gradient descent method applied to the negative free energy.
3. Prediction errors are introduced as new variables to extend the dynamical system and satisfy Hebbian plasticity.

- Most likely value of the feature is a scalar variable $\phi \in \Omega_\phi$.
- Equivalent to maximize negative free energy with respect to the feature:

$$F(\phi, u) = \ln(p(\phi|u)p(u|\phi)) \quad (3)$$

- Prediction errors:

$$e_\phi = \frac{v - g_\phi}{\Sigma_\phi} \quad (4)$$

$$e_u = \frac{u - g(u)}{\Sigma_u} \quad (5)$$

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Neural implementation

- Note that hypotheses are satisfied.

Fig. 3 from article: network implementation of the dynamical system

$$\begin{cases} \dot{\phi} = \varepsilon_d g'(\phi) - \varepsilon_p \\ \dot{\varepsilon}_p = \phi - v_p - \Sigma_p \varepsilon_p \\ \dot{\varepsilon}_u = u - g(\phi) - \Sigma_u \varepsilon_u \end{cases} \quad (6)$$

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- └ Single variable model

- └ Learning model parameters

- Choose model parameters to maximize $p(u)$.

1. Model parameters are mean and variance of variables.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- Choose model parameters to maximize $p(u)$.
- Equivalent to maximize negative free energy with respect to parameters:

$$\frac{\partial F}{\partial \psi_0} = \frac{\phi - \psi_0}{\Sigma_\psi} , \quad (7)$$

$$\frac{\partial F}{\partial \Sigma_\psi} = \frac{1}{2} \left(\frac{(\phi - \psi_0)^2}{\Sigma_\psi^2} - \frac{1}{\Sigma_\psi} \right) , \quad (8)$$

$$\frac{\partial F}{\partial \Sigma_u} = \frac{1}{2} \left(\frac{(u - g(\phi))^2}{\Sigma_u^2} - \frac{1}{\Sigma_u} \right) . \quad (9)$$

└ Single variable model

└ Learning model parameters

1. Model parameters are mean and variance of variables.
2. The fixed point of this dynamical system exists only as sample mean over the occurred events of perception, where most likely feature value and stimulus are known.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Learning model parameters

1. Model parameters are mean and variance of variables.
2. The fixed point of this dynamical system exists only as sample mean over the occurred events of perception, where most likely feature value and stimulus are known.
3. Without prediction errors, the computation is still local.

- Choose model parameters to maximize $p(u)$.
- Equivalent to maximize negative free energy with respect to parameters:

$$\frac{\partial F}{\partial \mu_p} = \frac{\phi - \psi_p}{\Sigma_p} \quad (7)$$

$$\frac{\partial F}{\partial \Sigma_p} = \frac{1}{2} \left(\frac{(\phi - \psi_p)^2}{\Sigma_p^2} - \frac{1}{\Sigma_p} \right) \quad (8)$$

$$\frac{\partial F}{\partial \Sigma_u} = \frac{1}{2} \left(\frac{(u - g(\phi))^2}{\Sigma_u^2} - \frac{1}{\Sigma_u} \right) \quad (9)$$

- Hebbian plasticity is satisfied using prediction errors.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- └ Single variable model

- └ Learning relation parameter

1. Only one parameter is considered without loss of generality.

$$g(v, \theta) = \theta v \quad (10)$$

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Learning relation parameter

1. Only one parameter is considered without loss of generality.
2. The nonlinearity increases the complexity of the network and partially changes Hebbian plasticity, still keeping it local.

• Linear relation: $g(v, \theta) = \theta v$. (10)

• Nonlinear relation: $g(v, \theta) = \theta h(v)$. (11)

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Learning relation parameter

1. Only one parameter is considered without loss of generality.
2. The nonlinearity increases the complexity of the network and partially changes Hebbian plasticity, still keeping it local.
3. Same consideration of model parameters apply to the relation parameter.

- Linear relation: $g(v, \theta) = \theta v$. (10)

- Nonlinear relation: $g(v, \theta) = \theta h(v)$. (11)

- Gradient of negative free energy for learning:
$$\frac{\partial F}{\partial \theta} = \frac{u - \theta h(v)}{\Sigma_u} h(v) = e_u h(v) . \quad (12)$$

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Free energy framework

1. In general, the posterior is approximated by a simpler probability distribution and the divergence between the two is minimized.

• Minimization of Kullback-Leibler divergence:

$$KL(q(v)||p(v|u)) = \int_{\Omega_v} q(v) \ln \left(\frac{q(v)}{p(v|u)} \right) dv \quad . \quad (13)$$

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- Minimization of Kullback-Leibler divergence:

$$KL(q(v)||p(v|u)) = \int_{\Omega_v} q(v) \ln \left(\frac{q(v)}{p(v|u)} \right) dv \quad . \quad (13)$$

- Definition of negative free energy:

$$F(v, u) = \int_{\Omega_v} q(v) \ln \left(\frac{p(v, u)}{q(v)} \right) dv \quad . \quad (14)$$

└ Free energy framework

1. In general, the posterior is approximated by a simpler probability distribution and the divergence between the two is minimized.
2. Minimize KL divergence or maximize negative free energy to learn most likely model value, maximize marginal likelihood or maximize negative free energy to learn model parameters.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Single variable model

└ Free energy framework

1. In general, the posterior is approximated by a simpler probability distribution and the divergence between the two is minimized.
2. Minimize KL divergence or maximize negative free energy to learn most likely model value, maximize marginal likelihood or maximize negative free energy to learn model parameters.
3. Equation (3) is recovered using delta function centered in the most likely feature value as probability distribution.

- Minimization of Kullback-Leibler divergence:

$$KL(q(v)||p(v|u)) = \int_{\Omega_v} q(v) \ln \left(\frac{q(v)}{p(v|u)} \right) dv \quad (13)$$

- Definition of negative free energy:

$$F(v, u) = \int_{\Omega_v} q(v) \ln \left(\frac{p(v, u)}{q(v)} \right) dv \quad (14)$$

- For the models discussed in the paper: $q(v) = \delta(v - \hat{v})$.

- Multiple variables model

- Multiple variables model

- Calculus rules are extended to work elementwise on vectors and matrices, multivariate gaussian distribution and nonlinear relation between variables and stimuli are used.
- The inverse of covariance matrix depends on non-adjacent neurons, Hebbian plasticity is again partially satisfied.

Fig. 5 from article: example of a model with 2 features and 2 stimuli. Equations are rewritten using matrix notation, but local plasticity is not satisfied.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

- └ Multiple variables model

- └ Hierarchical structure implementation

1. Information is used and travels in different layers of the cortex.

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Multiple variables model

└ Hierarchical structure implementation

1. Information is used and travels in different layers of the cortex.
2. Note the elementwise product and matrices of model and relation parameters.

- Parallel to structure of cortical areas.
- Generalized equations for the inference task:

$$\hat{\phi}_i = -\tilde{r}_i + W(\hat{\phi}_i) \times \Theta_{i-1}^T \tilde{r}_{i-1} \quad (15)$$

$$\tilde{r}_i = \hat{\phi}_i - \Theta_i h(\hat{\phi}_{i+1}) - \Sigma_i \tilde{r}_i \quad (16)$$

- Generalized equations for the learning task:

$$\frac{\partial F}{\partial \Sigma} = \frac{1}{2}(\tilde{r} \tilde{r}^T - \Sigma^{-1}) \quad (17)$$

$$\frac{\partial F}{\partial \Theta} = \tilde{r}^T h(\hat{\phi}_{i+1})^T \quad (18)$$

2023-12-12

Summary of *A tutorial on the free-energy framework for modelling perception and learning* by Rafal Bogacz

└ Multiple variables model

└ Recover local plasticity

- The update rule for the model parameters is Hebbian and contains the learning rate as hyperparameter of the model.
- Convergence of prediction errors to the sample variances is guaranteed if the most likely feature values change at slower time scales.

Fig. 7 from article: networks satisfying local plasticity for (a) single variable model and (b) multiple variables model. They implement the generalized dynamical system

$$\begin{cases} \dot{\tilde{r}}_i = \tilde{r}_i - g(\tilde{r}_{i+1}) - \tilde{r}_i \\ \dot{\tilde{r}}_i = \mathbf{\Sigma} \tilde{r}_i - \tilde{r}_i \end{cases} \quad (19)$$
